RADIOLOGY REPORT

Exam Date: 01/10/2025

Report Date: 01/18/2025

Patient Name: John Anderson

MRN: 76549821

DOB: 06/18/1958

Age: 66

Sex: Male

Race: White

Ethnicity: Non-Hispanic

Weight: 82 kg

Height: 178 cm

Ordering Physician: Robert Thompson, MD

Radiologist: Jennifer Williams, MD

EXAMINATION PERFORMED

CT Chest with IV Contrast

CLINICAL INDICATION

66-year-old male, Former smoker (30 pack-years, quit 5 years ago) with persistent cough for 3 months. Recent chest X-ray showed a right upper lobe opacity.

IMPRESSION

- 1. 3.2 cm spiculated mass in the right upper lobe, highly suspicious for primary lung malignancy. Clinical stage T2aN2M0 (Stage IIIA) based on imaging findings.
- 2. Enlarged right paratracheal, subcarinal, and right hilar lymph nodes, concerning for nodal metastases.

- 3. Mild centrilobular emphysema, consistent with smoking history.
- 4. No evidence of distant metastatic disease in the visualized structures.
